

On a class of submanifolds in tangent bundle with g - natural metric-normal lift

Stanisław Ewert-Krzemieniewski

July 26, 2016

Abstract

An isometric immersion of a Riemannian manifold M into a Riemannian manifold N gives rise in a natural way to variety of immersions into the tangent bundle TN with a non-degenerate g - natural metric G . In the paper we introduce and study an immersion into TN define defined by the immersion $f : M \rightarrow N$ itself and the normal bundle.

Mathematics Subject Classification Primary 53B20, 53C07, secondary 53B21, 55C25.

Key words: Riemannian manifold, tangent bundle, g - natural metric, submanifold, isometric immersion, totally geodesic, non-degenerate metric.

1 Introduction

An isometric immersion of a Riemannian manifold M into a Riemannian manifold N gives rise in a natural way to variety of immersions into the tangent bundle TN with a non-degenerate g - natural metric G . The isometric immersion defined by the tangent bundle of the submanifold was introduce by author in ([11]). In the present paper we introduce and study an immersion $\tilde{f} : LM \rightarrow TN$ define by the immersion $f : M \rightarrow N$ itself and the normal bundle.

In Preliminaries we recall basic facts on the decomposition of the tangent bundle and g - natural metrics. We also present basic notions on submanifolds and give short resumé on van der Waerden-Bortolotti covariant derivative. In Section 3 basic equations are presented. The main results are given in Section 4. We give the condition sufficient for LM being totally geodesic submanifold of TN .

Throughout the paper all manifolds under consideration are Hausdorff and smooth ones. The metrics on the base manifolds are Riemannian ones and the metrics on tangent spaces are non-degenerate. We adopt the Einstein summation convention.

2 Preliminaries

2.1 Decomposition of the tangent space

Let $\pi : TN \rightarrow N$ be the tangent bundle of a manifold N with the Levi-Civita connection ∇ on N , π being the projection. Then at each point $(x, u) \in TN$ the tangent space $T_{(x,u)}TN$ splits into direct sum of two isomorphic spaces $V_{(x,u)}TN$ and $H_{(x,u)}TN$, where

$$V_{(x,u)}TN = \text{Ker}(d\pi|_{(x,u)}), \quad H_{(x,u)}TN = \text{Ker}(K|_{(x,u)})$$

and K is the connection map ([7]) see also ([14]).

More precisely, if $Z = \left(Z^r \frac{\partial}{\partial x^r} + \overline{Z}^r \frac{\partial}{\partial u^r} \right) |_{(x,u)} \in T_{(x,u)}TN$, $r = 1, \dots, n$, then the vertical and horizontal projections of Z on T_xN are given by

$$(d\pi)_{(x,u)} Z = \overline{Z}^r \frac{\partial}{\partial x^r} |_x, \quad K_{(x,u)}(Z) = \left(\overline{Z}^r + u^s Z^t \Gamma_{st}^r \right) \frac{\partial}{\partial x^r} |_x,$$

where Γ_{st}^r are components of the Levi-Civita connection on N .

On the other hand, to each vector field X on N there correspond uniquely determined vector fields X^v and X^h on TN such that

$$\begin{aligned} d\pi|_{(x,u)}(X^v) &= 0, & K|_{(x,u)}(X^v) &= X, \\ K|_{(x,u)}(X^h) &= 0, & d\pi|_{(x,u)}(X^h) &= X. \end{aligned}$$

X^v and X^h are called the vertical lift and the horizontal lift of a given X to TN respectively.

In local coordinates (x^r, u^r) on TN , the horizontal and vertical lifts of a vector field $X = X^r \frac{\partial}{\partial x^r}$ on N to TN are vector fields given respectively by

$$X^h = X^r \frac{\partial}{\partial x^r} - u^s X^t \Gamma_{st}^r \frac{\partial}{\partial u^r}, \quad X^v = X^r \frac{\partial}{\partial u^r}. \quad (1)$$

Recall that for a given isometric immersion $f : M \rightarrow N$, we have two tangent bundles $\pi_N : TN \rightarrow N$ and $\pi_M : TM \rightarrow M$, where the latter is the subbundle of the former one. Let M, N be two Riemannian manifolds with metrics g_M and g_N and Levi-Civita connections ∇_M and ∇_N respectively. Then $T_p TM$ and $T_p TN$ have at a common point p their own decompositions into vertical and horizontal parts, i.e.

$$T_p TM = V_p TM \oplus H_p TM = V_M \oplus H_M$$

and

$$T_p TN = V_p TN \oplus H_p TN = V_N \oplus H_N,$$

but neither $V_M \subset V_N$ nor $H_M \subset H_N$ need to hold along TM . See also ([14])

Remark also that totally geodesic submanifolds of tangent bundle with g -natural metric are also studied in ([1]) and ([10]).

2.2 Preliminaries on g -natural metrics

In ([12]) the class of g -natural metrics was defined. We have

Lemma 1 ([12], [2], [3]) *Let (M, g) be a Riemannian manifold and G be a g -natural metric on TM . There exist functions $a_j, b_j :]0, \infty) \rightarrow \mathbb{R}$, $j = 1, 2, 3$, such that for every $X, Y, u \in T_x M$*

$$\begin{aligned} G_{(x,u)}(X^h, Y^h) &= (a_1 + a_3)(r^2)g_x(X, Y) + (b_1 + b_3)(r^2)g_x(X, u)g_x(Y, u), \\ G_{(x,u)}(X^h, Y^v) &= G_{(x,u)}(X^v, Y^h) = a_2(r^2)g_x(X, Y) + b_2(r^2)g_x(X, u)g_x(Y, u), \\ G_{(x,u)}(X^v, Y^v) &= a_1(r^2)g_x(X, Y) + b_1(r^2)g_x(X, u)g_x(Y, u), \end{aligned}$$

where $r^2 = g_x(u, u)$. For $\dim M = 1$ the same holds for $b_j = 0$, $j = 1, 2, 3$.

Setting $a_1 = 1$, $a_2 = a_3 = b_j = 0$ we obtain the Sasaki metric, while setting $a_1 = b_1 = \frac{1}{1+r^2}$, $a_2 = b_2 = 0$, $a_1 + a_3 = 1$, $b_1 + b_3 = 1$ we get the Cheeger-Gromoll one.

Following ([2]) we put

1. $a(t) = a_1(t)(a_1(t) + a_3(t)) - a_2^2(t)$,
2. $F_j(t) = a_j(t) + tb_j(t)$,
3. $F(t) = F_1(t)[F_1(t) + F_3(t)] - F_2^2(t)$
for all $t \in]0, \infty)$.

We shall often abbreviate: $A = a_1 + a_3$, $B = b_1 + b_3$.

Lemma 2 ([2], Proposition 2.7) *The necessary and sufficient conditions for a g -natural metric G on the tangent bundle of a Riemannian manifold (M, g) to be non-degenerate are*

$$a(t) \neq 0, \quad F(t) \neq 0$$

for all $t \in]0, \infty)$. If $\dim M = 1$ this is equivalent to $a(t) \neq 0$ for all $t \in]0, \infty)$.

Moreover, (TM, G) is Riemannian one if and only if

$$a(t) > 0, \quad F(t) > 0, \quad a_1(t) > 0, \quad F_1(t) > 0$$

holds for all $t \in]0, \infty)$.

We also have

Proposition 3 ([4], [5]) *Let (N, g) be a Riemannian manifold, ∇ its Levi-Civita connection and R its Riemann curvature tensor. If G is a non-degenerate g -natural metric on TN , then the Levi-Civita connection $\tilde{\nabla}$ of (TN, G) is given at a point $(x, u) \in TN$ by*

$$\left(\tilde{\nabla}_{X^h} Y^h \right)_{(x,u)} = (\nabla_X Y)_{(x,u)}^h + h \{ \mathbf{A}(u, X_x, Y_x) \} + v \{ \mathbf{B}(u, X_x, Y_x) \},$$

$$\begin{aligned}
\left(\tilde{\nabla}_{X^h} Y^v\right)_{(x,u)} &= (\nabla_X Y)_{(x,u)}^v + h\{\mathbf{C}(u, X_x, Y_x)\} + v\{\mathbf{D}(u, X_x, Y_x)\}, \\
\left(\tilde{\nabla}_{X^v} Y^h\right)_{(x,u)} &= h\{\mathbf{C}(u, Y_x, X_x)\} + v\{\mathbf{D}(u, Y_x, X_x)\}, \\
\left(\tilde{\nabla}_{X^v} Y^v\right)_{(x,u)} &= h\{\mathbf{E}(u, X_x, Y_x)\} + v\{\mathbf{F}(u, X_x, Y_x)\},
\end{aligned}$$

where $\mathbf{A}, \mathbf{B}, \mathbf{C}, \mathbf{D}, \mathbf{E}, \mathbf{F}$ are some F -tensors defined on the product $TN \otimes TN \otimes TN$.

Remark 4 Expressions for $\mathbf{A}, \mathbf{B}, \mathbf{C}, \mathbf{D}, \mathbf{E}, \mathbf{F}$ were presented for the first time in the original papers ([2],[3]). Unfortunately, they contain some misprints and omissions. Therefore, for the correct form, we refer the reader to ([4], [5]), see also ([8], [9]).

2.3 Submanifolds

Let M be a manifold isometrically immersed in a pseudo-Riemannian manifold N with metric g . Denote by $\tilde{\nabla}$ and ∇ , D^\perp the Levi-Civita connections of the metric g on N and this of the induced metric on M and by D^\perp the connection induced in the normal bundle $T^\perp M$. Then the Gauss and Weingarten equations hold

$$\begin{aligned}
\tilde{\nabla}_X Y &= \nabla_X Y + H(X, Y), \\
\tilde{\nabla}_X \eta &= -A_\eta X + D_X^\perp \eta,
\end{aligned}$$

for all vectors fields X, Y tangent to M and all vector fields η normal to M . Here $H(X, Y)$ is the second fundamental form which is symmetric and takes values in $T^\perp M$ while $A_\eta X$ is the shape operator taking values in TM . A_η and H are related by

$$g(A_\eta X, Y) = g(\eta, H(X, Y)).$$

M is said to be totally geodesic if $H(X, Y) = 0$ for all $X, Y \in TM$.

For the local immersion $x^r = x^r(y^a)$, $r = 1, \dots, n$, $a = 1, \dots, m$ the components of the Levi-Civita connection ∇ of the induced metric $g_{ab} = g_{rs} B_a^r B_b^s$, $B_a^r = \frac{\partial x^r}{\partial y^a}$, are

$$\Gamma_{ab}^c = [B_{a.b}^r + \Gamma_{st}^r B_a^s B_b^t] B_r^c, \quad B_r^c = g^{cd} B_d^t g_{tr}.$$

where the dot denotes partial derivative with respect to y^b .

Similarly, the components of the connection D^\perp are

$$\Gamma_{ay}^x = [N_{y.a}^r + \Gamma_{st}^r B_a^s N_y^t] N_r^x, \quad N_r^x = g^{xy} N_y^t g_{tr}.$$

2.3.1 Van der Waerden-Bortolotti covariant derivative

Van der Waerden-Bortolotti covariant derivative $\bar{\nabla}$ is a covariant differentiation of tensor fields of mixed types defined along a submanifold M isometrically immersed in a semi-Riemannian manifold (N, g) and can be considered as a direct sum $\tilde{\nabla} \oplus \nabla \oplus \nabla^\perp$ of the Levi-Civita connections of the metric g on N , the one induced on M and of the metric induced in normal bundle $T^\perp M$.

If \tilde{X} , X and η are vector fields, respectively, tangent to N , tangent to M , normal to M and \tilde{X}^* , X^* , η^* are respective 1-forms, then,

$$\begin{aligned} (\bar{\nabla}_Y T) (\tilde{X}, X, \eta, \tilde{X}^*, X^*, \eta^*) &= Y \left(T (\tilde{X}, X, \eta, \tilde{X}^*, X^*, \eta^*) \right) - \\ &T \left(\tilde{\nabla}_Y \tilde{X}, X, \eta, \tilde{X}^*, X^*, \eta^* \right) - T \left(\tilde{X}, X, \eta, \tilde{\nabla}_Y \tilde{X}^*, X^*, \eta^* \right) - \\ &T \left(\tilde{X}, \nabla_Y X, \eta, \tilde{X}^*, X^*, \eta^* \right) - T \left(\tilde{X}, X, \eta, \tilde{X}^*, \nabla_Y X^*, \eta^* \right) - \\ &T \left(\tilde{X}, X, \nabla_Y^\perp \eta, \tilde{X}^*, X^*, \eta^* \right) - T \left(\tilde{X}, X, \eta, \tilde{X}^*, X^*, \nabla_Y^\perp \eta^* \right) \end{aligned}$$

for any vector field Y tangent to M and tensor field T of mixed type $(3, 3)$.

Let $x^k = x^k(y^a)$ be the local expression of the immersion, $B_a^k = \frac{\partial x^k}{\partial y^a}$, $N_x^r = \frac{\partial x^r}{\partial x^a}$ unit vectors normal to M .

For the local coordinate vector fields $\frac{\partial}{\partial x^k}$ tangent to N , $\frac{\partial}{\partial y^a}$ tangent to M , $\frac{\partial}{\partial v^x}$ normal to M and the respective 1-forms dx^k , dy^a , dv^x denote by Γ_{hk}^l , Γ_{ab}^c , Γ_{ay}^z components of the connections $\tilde{\nabla}$, ∇ and ∇^\perp . If

$$T = T_{hax}^{kby} \frac{\partial}{\partial x^k} \otimes dx^h \otimes \frac{\partial}{\partial y^b} \otimes dy^a \otimes \frac{\partial}{\partial v^y} \otimes dv^x,$$

then

$$\begin{aligned} \nabla_c T_{hax}^{kby} &= \partial_b T_{hax}^{kby} - \Gamma_{hr}^s B_c^r T_{sax}^{kby} + \Gamma_{rs}^k B_c^r T_{hax}^{sby} - \\ &\Gamma_{ca}^d T_{hdx}^{kby} + \Gamma_{cd}^b T_{hax}^{kdy} - \Gamma_{cx}^z T_{haz}^{kby} + \Gamma_{cz}^y T_{hax}^{kbz}, \end{aligned}$$

where $h, k, r, s = 1, \dots, n$, $a, b, c, d = 1, \dots, m$, $m < n$, and $x, y, z = m+1, \dots, n$.

In particular, $\bar{\nabla}_a B_b^r$ and $\bar{\nabla}_a N_x^r$ give rise to the components of the second fundamental form and the shape operator:

$$\begin{aligned} \bar{\nabla}_b B_a^r \partial_r &= (B_{a.b}^r + \Gamma_{st}^r B_a^s B_b^t - \Gamma_{ab}^c B_c^r) \partial_r = h_{ab}^z N_z^r \partial_r, \\ \bar{\nabla}_a N_x^r \partial_r &= (\partial_a N_x^r + \Gamma_{st}^r B_a^s N_x^t - \Gamma_{ax}^y N_y^r) \partial_r. \end{aligned} \quad (2)$$

In a free of coordinate notation we have respectively:

$$\bar{\nabla}_X Y = \tilde{\nabla}_X Y - \nabla_X Y,$$

$$\bar{\nabla}_X \eta = \tilde{\nabla}_X \eta - D_X^\perp \eta.$$

See also ([13]) and ([15]).

2.3.2 Isometric immersion defined by normal bundle

Let $f : M \longrightarrow N$ be an isometric immersion of a Riemannian manifold M into a Riemannian manifold N . Suppose that the following diagram holds

$$\begin{array}{ccc}
 (\pi_N^{-1}(U), (x^r, u^r)) & \xleftarrow{\quad \tilde{f} \quad} & ((\pi_M^\perp)^{-1}(V), (y^a, v^a)) \\
 \downarrow \pi_N & & \downarrow \pi_M^\perp \\
 (U, (x^r)) & \xleftarrow{\quad f \quad} & (V, (y^a))
 \end{array} \quad ,$$

where $(U, (x^r))$ and $(V, (y^a))$ are coordinate neighbourhoods on N and M respectively while the local expression for f is:

$$f : x^r = x^r(y^a)$$

Let

$$\eta_x = N_x^r \frac{\partial}{\partial x^r}, \quad x = m+1, \dots, n$$

be a set of unit vectors normal to M .

The coordinate neighbourhoods on TN and normal bundle $T^\perp M$ are defined respectively by

$$\begin{aligned}
 &((x^r), (u^r)), \quad r = 1, \dots, n, \\
 &((y^a), (v^x)), \quad x = m+1, \dots, n, \quad a = 1, \dots, m,
 \end{aligned}$$

where $(u^r)_{r=1, \dots, n}$, are components of the vector u tangent to N at a point with coordinates (x^r) and $(v^x)_{x=m+1, \dots, n}$ are components of the vector normal to M at a point $x^r = x^r(y^a)$.

If

$$f : M \longrightarrow N; \quad (y^a) \mapsto x^r(y^a)$$

then

$$\tilde{f} : x^r = x^r(y^a), \quad u^r = v^x N_x^r \quad (3)$$

defines locally an immersion into TN .

2.3.3 Vectors tangent to LM

The coordinate vector fields tangent to $LM = \tilde{f}(TM^\perp)$ are

$$\frac{\partial}{\partial v^x} = N_x^r \frac{\partial}{\partial u^r} = (\eta_x)^v,$$

$$\begin{aligned}
\frac{\partial}{\partial y^a} &= B_a^r \frac{\partial}{\partial x^r} + v^z \partial_a N_z^r \frac{\partial}{\partial u^r} \stackrel{(2)}{=} \\
&B_a^r \left(\frac{\partial}{\partial x^r} - v^z N_z^t \Gamma_{tr}^s \frac{\partial}{\partial u^s} \right) + v^z \bar{\nabla}_a N_z^r \frac{\partial}{\partial u^r} + v^z \Gamma_{az}^y N_y^r \frac{\partial}{\partial u^r} \stackrel{(3),(1)}{=} \\
&\left(\frac{\delta}{\delta y^a} \right)^h + M_a^r \left(\frac{\partial}{\partial x^r} \right)^v + N_a^r \left(\frac{\partial}{\partial x^r} \right)^v = \\
&\left(\frac{\delta}{\delta y^a} \right)^h + (M_a)^v + (N_a)^v,
\end{aligned}$$

where $M_a = v^z \bar{\nabla}_a N_z^r \frac{\partial}{\partial x^r} = v^z M_{az}$ are tangent to M and $N_a = v^z \Gamma_{az}^y N_y^r \frac{\partial}{\partial x^r} = N_a^y N_y^r \frac{\partial}{\partial x^r}$ are normal to M .

3 Basic equations

In this section we derive, using the equations of Gauss and Weingarten and the formulas for the Levi-Civita connection on (TN, G) with a non-degenerate g -natural metric G , the basic equations for the immersion given by (3) to be used throughout the paper. $H^h + V^v$ is a unique decomposition of a vector field normal to LM into its horizontal and vertical parts, where H and V are vector fields along M . The computations in this section were performed and checked by the use Mathematica software.

Equation 1

$$\begin{aligned}
G(\tilde{\nabla}_{\partial_x} \partial_y, H^h + V^v) &= G(\tilde{H}(\partial_x, \partial_y), H^h + V^v) = \\
&G(\tilde{\nabla}_{\eta_x^v} \eta_y^v, H^h + V^v) = \\
&G(h\{\mathbf{E}(u, \eta_x, \eta_y)\} + v\{\mathbf{F}(u, \eta_x, \eta_y)\}, H^h + V^v) =
\end{aligned}$$

$$\begin{aligned}
&b_2 g(\eta_x, \eta_y) g(u, H) + (b_1 - a'_1) g(\eta_x, \eta_y) g(u, V) + \\
&a'_1 g(\eta_x, V) g(u, \eta_y) + a'_1 g(\eta_y, V) g(u, \eta_x) + \\
&\left(a'_2 + \frac{b_2}{2} \right) (g(\eta_x, H) g(u, \eta_y) + g(\eta_y, H) g(u, \eta_x)) + \\
&g(u, \eta_x) g(u, \eta_y) g(u, b'_1 V + 2b'_2 H). \quad (4)
\end{aligned}$$

$$\begin{aligned}
G(\tilde{\nabla}_{\partial_x} (H^h + V^v), \partial_y) &= G(-\tilde{A}_{H^h + V^v} \partial_x, \partial_y) = \\
G(h\{\mathbf{C}(u, H, \eta_x)\} + v\{\mathbf{D}(u, H, \eta_x)\} + h\{\mathbf{E}(u, \eta_x, V)\} + v\{\mathbf{F}(u, \eta_x, V)\}, \eta_y^v) &=
\end{aligned}$$

$$\begin{aligned}
& (b_1 - a'_1)g(\eta_x, V)g(u, \eta_y) + a'_1g(\eta_y, V)g(u, \eta_x) + a'_1g(\eta_x, \eta_y)g(u, V) + \\
& \left(a'_2 - \frac{b_2}{2}\right) (g(\eta_y, H)g(u, \eta_x) - g(\eta_x, H)g(u, \eta_y)) + \\
& b'_1g(u, \eta_x)g(u, \eta_y)g(u, V).
\end{aligned}$$

In virtue of the equality

$$G(\tilde{H}(\partial_x, \partial_y), H^h + V^v) - G(\tilde{A}_{H^h + V^v} \partial_x, \partial_y) = 0 \quad (5)$$

the above two equations yield

$$g(u, \eta_x)g(\eta_y, T) - g(u, \eta_y)g(\eta_x, T) = 0,$$

where $T = (b'_1 - 2a'_1)V + (b'_2 - 2a'_2)H$.

Equation 2

$$\begin{aligned}
& G(\tilde{\nabla}_{\partial_x} \partial_a, H^h + V^v) = G(\tilde{H}(\partial_x, \partial_a), H^h + V^v) = \\
& G(\tilde{\nabla}_{\eta_x^v}(\delta_a^h + M_a^v + N_a^v), H^h + V^v) = \\
& G(h\{\mathbf{C}(u, \delta_a, \eta_x)\} + v\{\mathbf{D}(u, \delta_a, \eta_x)\}, H^h + V^v) + \\
& G(h\{\mathbf{E}(u, \eta_x, M_a + N_a)\} + v\{\mathbf{F}(u, \eta_x, M_a + N_a)\}, H^h + V^v) = \\
& -\frac{1}{2}a_1R(H, \delta_a, u, \eta_x) + A'g(H, \delta_a)g(u, \eta_x) + \left(a'_2 - \frac{b_2}{2}\right)g(V, \delta_a)g(u, \eta_x) + \\
& (b_1 - a'_1)g(u, V)g(N_a, \eta_x) + b_2g(u, H)g(N_a, \eta_x) + \\
& a'_1g(u, \eta_x)g(V, M_a + N_a) + a'_1g(u, N_a)g(V, \eta_x) + \\
& \left(a'_2 + \frac{b_2}{2}\right) [g(H, M_a + N_a)g(u, \eta_x) + g(H, \eta_x)g(u, N_a)] + \\
& g(u, b'_1V + 2b'_2H)g(u, \eta_x)g(u, N_a) \quad (6)
\end{aligned}$$

$$\begin{aligned}
& G(\tilde{\nabla}_{\partial_x} (H^h + V^v), \partial_a) = G(-\tilde{A}_{H^h + V^v} \partial_x, \partial_a) = \\
& G(\tilde{\nabla}_{\partial_x} (H^h + V^v), \delta_a^h + M_a^v + N_a^v) = \\
& G(h\{\mathbf{C}(u, H, \eta_x)\} + v\{\mathbf{D}(u, H, \eta_x)\}, \delta_a^h + M_a^v + N_a^v) + \\
& G(h\{\mathbf{E}(u, \eta_x, V)\} + v\{\mathbf{F}(u, \eta_x, V)\}, \delta_a^h + M_a^v + N_a^v) = \\
& \frac{1}{2}a_1R(H, \delta_a, u, \eta_x) + (b_1 - a'_1)g(u, N_a)g(V, \eta_x) + a'_1g(u, \eta_x)g(V, M_a + N_a) + \\
& a'_1g(u, V)g(N_a, \eta_x) + \left(a'_2 + \frac{b_2}{2}\right)g(u, \eta_x)g(V, \delta_a) + \\
& \left(a'_2 - \frac{b_2}{2}\right) [g(H, M_a + N_a)g(u, \eta_x) - g(H, \eta_x)g(u, N_a)] + \\
& A'g(H, \delta_a)g(u, \eta_x) + b'_1g(u, \eta_x)g(u, N_a)g(u, V). \quad (7)
\end{aligned}$$

Hence, in virtue of (5), we get

$$\begin{aligned} &g(u, b_1 V + b_2 H)g(N_a \eta_x) + 2g(u, \eta_x)g(A' H + a'_2 V, \delta_a) + \\ &\quad 2g(u, \eta_x)g(a'_1 V + a'_2 H, M_a + N_a) + \\ &\quad g(u, N_a)[g(b_1 V + b_2 H, \eta_x) + 2g(u, \eta_x)g(b'_1 V + b'_2 H, u)] = 0 \end{aligned}$$

Equation 3

$$\begin{aligned} G(\tilde{\nabla}_{\partial_a} \partial_x, H^h + V^v) &= G(\tilde{H}(\partial_a, \partial_x), H^h + V^v) = \\ &G(\tilde{\nabla}_{(\delta_a^h + M_a^v + N_a^v)}(\eta_x)^v, H^h + V^v) = \end{aligned}$$

$$\begin{aligned} &G((\nabla_{\delta_a} \eta_x)^v + h\{\mathbf{C}(u, \delta_a, \eta_x)\} + v\{\mathbf{D}(u, \delta_a, \eta_x)\}, H^h + V^v) + \\ &\quad G(h\{\mathbf{E}(u, \eta_x, M_a + N_a)\} + v\{\mathbf{F}(u, \eta_x, M_a + N_a)\}, H^h + V^v). \end{aligned}$$

Since $\tilde{H}(\partial_a, \partial_x)$ is symmetric, comparing the last equation with (6), we obtain

$$G((\nabla_{\delta_a} \eta_x)^v, H^h + V^v) = 0. \quad (8)$$

$$\begin{aligned} G(\tilde{\nabla}_{\partial_a} (H^h + V^v), \partial_x) &= G(-\tilde{A}_{H^h + V^v} \partial_a, \partial_x) = \\ &G(\tilde{\nabla}_{(\delta_a^h + M_a^v + N_a^v)}(H^h + V^v), \eta_x^v) = \\ &G((\nabla_{\delta_a} H)^h + h\{\mathbf{A}(u, \delta_a, H)\} + v\{\mathbf{B}(u, \delta_a, H)\}, \eta_x^v) + \\ &G((\nabla_{\delta_a} V)^v + h\{\mathbf{C}(u, \delta_a, V)\} + v\{\mathbf{D}(u, \delta_a, V)\}, \eta_x^v) + \\ &G(h\{\mathbf{C}(u, H, M_a + N_a)\} + v\{\mathbf{D}(u, H, M_a + N_a)\}, \eta_x^v) + \\ &G(h\{\mathbf{E}(u, M_a + N_a, V)\} + v\{\mathbf{F}(u, M_a + N_a, V)\}, \eta_x^v) = \end{aligned}$$

$$\begin{aligned} &\frac{1}{2}a_1 R(H, \delta_a, u, \eta_x) + a_1 g(\eta_x, \nabla_{\delta_a} V) + b_1 g(u, \eta_x)g(u, \nabla_{\delta_a} V) + \\ &\quad a_2 g(\eta_x, \nabla_{\delta_a} H) + b_2 g(u, \eta_x)g(u, \nabla_{\delta_a} H) - A' g(u, \eta_x)g(H, \delta_a) + \\ &(b_1 - a'_1)g(u, \eta_x)g(V, M_a + N_a) + a'_1 g(u, N_a)g(V, \eta_x) + a'_1 g(u, V)g(N_a, \eta_x) + \\ &\quad \left(a'_2 + \frac{b_2}{2}\right)[g(H, \eta_x)g(u, N_a) - g(H, M_a + N_a)g(u, \eta_x) - g(u, \eta_x)g(V, \delta_a)] + \\ &\quad b'_1 g(u, V)g(u, N_a)g(u, \eta_x). \quad (9) \end{aligned}$$

Equation 4

$$\begin{aligned}
G(\tilde{\nabla}_{\partial_a} \partial_b, H^h + V^v) &= G(\tilde{H}(\partial_a, \partial_b), H^h + V^v) = \\
&G(\tilde{\nabla}_{(\delta_a^h + M_a^v + N_a^v)}(\delta_b^h + M_b^v + N_b^v), H^h + V^v) = \\
&G((\nabla_{\delta_a} \delta_b)^h + h\{\mathbf{A}(u, \delta_a, \delta_b)\} + v\{\mathbf{B}(u, \delta_a, \delta_b)\} + \\
&(\nabla_{\delta_a}(M_b + N_b))^v + h\{\mathbf{C}(u, \delta_a, M_b + N_b)\} + v\{\mathbf{D}(u, \delta_a, M_b + N_b)\} + \\

&h\{\mathbf{E}(u, M_a + N_a, M_b + N_b)\} + v\{\mathbf{F}(u, M_a + N_a, M_b + N_b)\}, H^h + V^v) = \\
&-a_2 R(H, \delta_b, u, \delta_a) - \\
&\frac{1}{2}a_1 R(H, \delta_a, u, M_b + N_b) - \frac{1}{2}a_1 R(H, \delta_b, u, M_a + N_a) - \frac{1}{2}a_1 R(u, V, \delta_a, \delta_b) + \\
&g(AH + a_2 V, \nabla_{\delta_a} \delta_b) + g(BH + b_2 V, u)g(u, \nabla_{\delta_a} \delta_b) + \\
&\frac{1}{2}Bg(H, u)(g(M_a, \delta_b) + g(M_b, \delta_a)) + \\
&g(a_1 V + a_2 H, \nabla_{\delta_a}(M_b + N_b)) + g(b_2 H + b_1 V, u)g(u, \nabla_{\delta_a}(M_b + N_b)) + \\
&+ g(b_2 H + (b_1 - a'_1)V, u)(g(M_a, M_b) + g(N_a, N_b)) + \\
&A'[g(H, \delta_a)g(u, N_b) + g(H, \delta_b)g(u, N_a) - g(V, u)g(\delta_a, \delta_b)] + \\
&a'_1 g(u, N_a)g(V, M_b + N_b) + a'_1 g(u, N_b)g(V, M_a + N_a) + \\
&\left(a'_2 - \frac{b_2}{2}\right)\{g(u, N_b)g(V, \delta_a) - g(u, V)[g(M_b, \delta_a) + g(M_a, \delta_b)]\} + \\
&\left(a'_2 + \frac{b_2}{2}\right)(g(H, M_a + N_a)g(u, N_b) + g(H, M_b + N_b)g(u, N_a)) + \\
&g(u, b'_1 V + 2b'_2 H)g(u, N_a)g(u, N_b), \quad (10)
\end{aligned}$$

$$\begin{aligned}
G(\tilde{\nabla}_{\partial_a}(H^h + V^v), \partial_{bx}) &= G(-\tilde{A}_{H^h + V^v} \partial_a, \partial_b) = \\
&G(\tilde{\nabla}_{(\delta_a^h + M_a^v + N_a^v)}(H^h + V^v), \eta_b^v) =
\end{aligned}$$

$$\begin{aligned}
&a_2 R(H, \delta_b, u, \delta_a) + \\
&\frac{1}{2}a_1 R(H, \delta_a, u, M_b + N_b) + \frac{1}{2}a_1 R(H, \delta_b, u, M_a + N_a) + \frac{1}{2}a_1 R(u, V, \delta_a, \delta_b) + \\
&Ag(\delta_b, \nabla_{\delta_a} H) + a_2 g(\delta_b, \nabla_{\delta_a} V) + a_2 g(M_b + N_b, \nabla_{\delta_a} H) + a_1 g(M_b + N_b, \nabla_{\delta_a} V) + \\
&\frac{1}{2}Bg(H, u)(g(M_a, \delta_b) - g(M_b, \delta_a)) + \\
&g(u, N_b)(b_2 g(u, \nabla_{\delta_a} H) + b_1 g(u, \nabla_{\delta_a} V)) + \\
&A'(-g(H, \delta_a)g(u, N_b) + g(H, \delta_b)g(u, N_a) + g(V, u)g(\delta_a, \delta_b)) + \\
&(b_1 - a'_1)g(u, N_b)g(V, M_a + N_a) + a'_1 g(u, N_a)g(V, M_b + N_b) +
\end{aligned}$$

$$\begin{aligned}
& a'_1 g(V, u) [g(M_a, M_b) + g(N_a, N_b)] + \\
& \left(a'_2 - \frac{b_2}{2}\right) (g(u, V)g(M_b, \delta_a) - g(u, N_b)g(V, \delta_a)) + \\
& \left(a'_2 + \frac{b_2}{2}\right) (g(u, V)g(M_a, \delta_b) + g(u, N_a)g(V, \delta_b)) + \\
& \left(a'_2 - \frac{b_2}{2}\right) [g(-H, M_a + N_a)g(u, N_b) + g(H, M_b + N_b)g(u, N_a)] + \\
& b'_1 g(u, V)g(u, N_a)g(u, N_b),
\end{aligned}$$

Applying (5), we find

$$\begin{aligned}
0 = & g(AH + a_2 V, \nabla_{\delta_a} \delta_b) + \\
& g(BH + b_2 V, u)g(u, \nabla_{\delta_a} \delta_b) + g(a_2 H + a_1 V, \nabla_{\delta_a} (M_b + N_b)) + \\
& a_2 g(M_b + N_b, \nabla_{\delta_a} H) + a_1 g(M_b + N_b, \nabla_{\delta_a} V) + \\
& Ag(\delta_b, \nabla_{\delta_a} H) + a_2 g(\delta_b, \nabla_{\delta_a} V) + g(BH + b_2 V, u)g(M_a, \delta_b) + \\
& g(u, b_2 H + b_1 V)g(u, \nabla_{\delta_a} (M_b + N_b)) + \\
& g(u, N_b) [b_1 g(u, \nabla_{\delta_a} V) + b_2 g(u, \nabla_{\delta_a} H) + g(b_2 H + b_1 V, M_a + N_a)] + \\
& g(u, b_2 H + b_1 V) [g(M_a, M_b) + g(N_a, N_b)] + 2g(u, N_a) \times \\
& [g(A'H + a'_2 V, \delta_b) + g(a'_2 H + a'_1 V, M_b + N_b) + g(u, N_b)g(b'_2 H + b'_1 V, u)].
\end{aligned}$$

4 Main results

The first proposition of this section establishes number of various relations that allow us to show that the right hand sides of the pairs of equations in each subsection of the former section equals. The results are presented in Proposition 8. Theorem 6 states the condition sufficient for the space normal to LM being spanned by lifts of vectors tangent to M . The main results are presented in Proposition 9 and Theorem 10.

Proposition 5 *Let \tilde{f} be the immersion given by (3) defined by the isometric immersion $f : M \rightarrow (N, g)$ into Riemannian manifold. Suppose, moreover, that TN is endowed with non-degenerate g -natural metric G . Then in the notation as above the following identities are satisfied.*

$$\begin{aligned}
1. & \quad g(\eta_x, S) = 0, \tag{11}
\end{aligned}$$

$$\text{where } S = a_2 H + a_1 V + g(u, b_2 H + b_1 V)u.$$

$$\begin{aligned}
2. & \quad g(u, S) = g(N_a, S) = 0. \tag{12}
\end{aligned}$$

$$\begin{aligned}
3. & \quad g(\nabla_{\delta_a} \eta_x, S) = 0. \tag{13}
\end{aligned}$$

$$4. \quad g(\eta_x, \nabla_{\delta_a} S) = 0. \quad (14)$$

$$5. \quad g(u, \nabla_{\delta_a} S) = g(N_b, \nabla_{\delta_a} S) = 0. \quad (15)$$

$$6. \quad g(\nabla_{\delta_a} u, S) = g(\nabla_{\delta_a} N_b, S) = 0. \quad (16)$$

$$7. \quad g(\delta_a, AH + a_2 V) = g(M_a, a_2 H + a_1 V) = 0. \quad (17)$$

$$8. \quad g(\delta_a, A' H + a'_2 V) = g(M_a, a'_2 H + a'_1 V) = 0. \quad (18)$$

$$9. \quad g(M_b, M_a) + g(u, \nabla_{\delta_a} M_b) = 0. \quad (19)$$

$$10. \quad g(M_b, \delta_a) + g(u, \nabla_{\delta_b} \delta_a) = 0. \quad (20)$$

$$11. \quad g(\nabla_{\delta_a} \eta_x, S_b) + g(\eta_x, \nabla_{\delta_a} S_b) = 0. \quad (21)$$

Moreover, if M is not a hypersurface of N , then

$$12. \quad X_u = g(u, b_2 H + b_1 V) = 0. \quad (22)$$

$$13. \quad X_{\eta_x} = g(\eta_x, b_2 H + b_1 V) = 0. \quad (23)$$

$$14. \quad Y_{\eta_x} = g(\eta_x, b'_2 H + b'_1 V) = 0. \quad (24)$$

$$15. \quad Y_u = g(u, b'_2 H + b'_1 V) = 0. \quad (25)$$

$$16. \quad Z_{\eta_x} = g(\eta_x, a'_2 H + a'_1 V) = 0, \quad Z_u = g(u, a'_2 H + a'_1 V) = 0. \quad (26)$$

$$17. \quad g(\eta_x, a_2 H + a_1 V) = 0. \quad (27)$$

Proof. (11) results from

$$G(\partial_x, H^h + V^v) = G(\eta_x^v, H^h + V^v) = 0.$$

Then (12) is obvious since $u = v^y N_y^r \partial_r = v^y \eta_y$ and $N_a = N_a^y \eta_y$ are normal to M . Now (13) is a consequence of (8), whence, by (11), (14) results.

Once again, by orthogonality of u and N_a with respect to M , we have (15). Consequently, in virtue of (12), we obtain (16).

Observe that the identity

$$(7) - (9) + g(\eta_x, \nabla_{\delta_a} S) - \sum_y \frac{\partial}{\partial v^y} g(\eta_x, S) N_a^y = 0 \quad (28)$$

gives

$$g(\delta_a, A'H + a'_2 V) + g(M_a, a'_2 H + a'_1 V) = 0.$$

On the other hand, relations

$$G(\partial_a, H^h + V^v) = G(\delta_a^h + M_a^v + N_a^v, H^h + V^v) = 0$$

and (12) yield

$$g(\delta_a, AH + a_2 V) + g(M_a, a_2 H + a_1 V) = 0. \quad (29)$$

Differentiating (29) with respect to v^x and using (28) we find

$$g(M_{ax}, a_2 H + a_1 V) = 0,$$

where $M_{ax} = \nabla_{\delta_a} N_x^r \partial_r$. Consequently, (29) yields (17). Hence, by differentiating with respect to v^x , (18) results.

Since M_a, δ_a are tangent to M and u, η_x are normal, by covariant differentiation we get (19) - (21).

Differentiating (11) with respect to v^y we get

$$g(\eta_x, \eta_y) X_u + 2g(\eta_x, u) g(u, \eta_y) Y_u + g(\eta_x, u) X_{\eta_y} + 2g(u, \eta_y) Z_{\eta_x} = 0,$$

where $X_u = g(u, b_2 H + b_1 V)$, $X_{\eta_x} = g(\eta_x, b_2 H + b_1 V)$, $Y_u = g(u, b'_2 H + b'_1 V)$, $Z_u = g(u, a'_2 H + a'_1 V)$ and $Z_{\eta_x} = g(\eta_x, a'_2 H + a'_1 V)$.

Transvecting in turn with $v^x, v^y, v^x v^y$ and, finally, contracting with g^{xy} we get for each $x = m + 1, \dots, n$ system of four equations:

$$\begin{aligned} v_x X_u + 2r^2 v_x Y_u + r^2 X_{\eta_x} + 2v_x Z_u &= 0, \\ v_x X_u + 2r^2 v_x Y_u + v_x X_u + 2r^2 Z_{\eta_x} &= 0, \\ r^2 (X_u + r^2 Y_u + Z_u) &= 0, \\ (n - m + 1) X_u + 2r^2 Y_u + 2Z_u &= 0, \end{aligned} \quad (30)$$

where $v_x = g(u, \eta_x)$. Solving with respect to $X, X_{\eta_x}, Y, Z_{\eta_x}$ we obtain

$$X_u = X_{\eta_x} = 0, \quad Y_u = -\frac{Z_u}{r^2}, \quad Z_{\eta_x} = -\frac{v_x Z_u}{r^2} \quad (31)$$

for any $u = v^x \eta_x \neq 0$. By continuity, $X_u = X_{\eta_x} = 0$ hold for any u . Then $\frac{\partial}{\partial v^z} X_{\eta_x} = Y_{\eta_x} g(\eta_z, u) = 0$ for all $u \neq 0$, whence, in virtue of continuity, $Y_{\eta_x} = 0$ for any u . Consequently, we have $Y_u = 0$. Now, $Z_u = 0$ follows from (30) and $Z_{\eta_x} = 0$ results from (31). Finally, (27) is a consequence of (11) and (22). Thus the lemma is proved. ■

Theorem 6 *Let (x, u) be a point of LM immersed in TN . If*

$$a_2 b_1 - a_1 b_2 \neq 0 \quad (32)$$

at $t = g(u, u)$, then the normal space at $(x, u) \in LM$ is spanned by lifts of vectors tangent to M .

Proof. It results from the identities (27) and (23). Notice that other conditions, similar to that of (32) can be deduced in the same way from (27), (26), (23) and (24). ■

We shall prove that the condition (32) is essential in that sense that there exist immersion $f : M \rightarrow N$ and metric G on TN such that $a_2 b_1 - a_1 b_2 = 0$ and at least one of the vectors H_2, V_2 does not vanish.

Example 7 *Let $f : S^1 \rightarrow (R^2, \text{Euclid metric})$ be the immersion given by $f(t) = [\cos t, \sin t]$. The vector tangent to S^1 is $s = [-\sin t, \cos t]$ and normal one is $n = [\cos t, \sin t]$. Then*

$$\begin{aligned} s^v &= [0, 0, -\sin t, \cos t], & s^h &= [-\sin t, \cos t, 0, 0], \\ n^v &= [0, 0, \cos t, \sin t], & n^h &= [\cos t, \sin t, 0, 0]. \end{aligned}$$

The vectors tangent to LS^1 are

$$\frac{\partial}{\partial t} = s^h + v s^v, \quad \frac{\partial}{\partial v} = n^v.$$

Suppose

$$H^h + V^v = \alpha s^h + \beta n^h + \gamma s^v + \delta n^v$$

and consider the non-degenerate g -natural metric on TR^2 such that $B = b_1 = b_2 = 0$.

Then

$$G\left(\frac{\partial}{\partial v}, H^h + V^v\right) = G(n^v, H^h + V^v) = a_2 g(n, H) + a_1 g(n, V) = a_2 \beta + a_1 \delta$$

and

$$G\left(\frac{\partial}{\partial t}, H^h + V^v\right) = G(s^h, H^h + V^v) = A g(s, H) + a_2 g(s, V) = A \alpha + a_2 \gamma.$$

We put

$$\alpha = -\frac{a_2 + v a_1}{A + v a_2} \gamma \neq 0, \quad \beta = -\frac{a_1}{a_2} \delta \neq 0.$$

Applying Proposition 5 to (4), (6) and (10) we obtain

Proposition 8 *Let M be a submanifold isometrically immersed in a manifold N . Then along LM we have*

$$\begin{aligned} \tilde{G} \left[H^h + V^v, \tilde{\nabla}_{\partial_x} \partial_y \right] &= \tilde{G} \left[H^h + V^v, \tilde{H}(\partial_x, \partial_y) \right] = \\ g \left[H, \frac{b_2}{2} g(u, \eta_x) \eta_y + \frac{b_2}{2} g(u, \eta_y) \eta_x + a'_2 g(\eta_x, \eta_y) u + b'_2 g(u, \eta_x) g(u, \eta_y) u \right], \\ \tilde{G} \left[H^h + V^v, \tilde{\nabla}_{\partial_x} \partial_b \right] &= \tilde{G} \left[H^h + V^v, \tilde{H}(\partial_x, \partial_a) \right] = \\ g \left[H, R(u, \eta_x) \delta_a \right] + \\ g \left[H, \frac{b_2}{2} g(u, N_a) \eta_x + \frac{b_2}{2} g(u, \eta_x) (M_a + N_a) + a'_2 g(N_a, \eta_x) u + b'_2 g(u, \eta_x) g(u, N_a) u \right] - \\ g \left[V, \frac{b_2}{2} g(u, \eta_x) \delta_a \right], \end{aligned}$$

$$\begin{aligned} \tilde{G} \left[H^h + V^v, \tilde{\nabla}_{\partial_a} \partial_b \right] &= \tilde{G} \left[H^h + V^v, \tilde{H}(\partial_a, \partial_b) \right] = \\ g \left[H, A \nabla_{\delta_a} \delta_b \right] - a_2 R(H, \delta_b, u, \delta_a) - \\ \frac{a_1}{2} \left[R(H, \delta_a, u, M_b + N_b) + R(H, \delta_b, u, M_a + N_a) + R(u, V, \delta_b, \delta_a) \right] + \\ g \left[V, a_1 \nabla_{\delta_a} (M_b + N_b) \right] - g \left[V, A' g(\delta_a, \delta_b) u + a'_1 g(M_a, M_b) u \right] + \\ g \left[H, a_2 \nabla_{\delta_a} (M_b + N_b) \right] + \\ g \left[H, \frac{b_2}{2} g(u, N_a) (M_b + N_b) + \frac{b_2}{2} g(u, N_b) (M_a + N_a) \right]. \end{aligned}$$

Proposition 9 *Let M be a submanifold isometrically immersed in a manifold N and suppose that the normal bundle of LM is spanned by vectors of the form $H^h + V^v$, where H and V are tangent to M . Then along LM we have*

$$\tilde{G} \left[H^h + V^v, \tilde{\nabla}_{\partial_x} \partial_y \right] = \tilde{G} \left[H^h + V^v, \tilde{H}(\partial_x, \partial_y) \right] = 0,$$

$$\begin{aligned} \tilde{G} \left[H^h + V^v, \tilde{\nabla}_{\partial_x} \partial_b \right] &= \tilde{G} \left[H^h + V^v, \tilde{H}(\partial_x, \partial_a) \right] = \\ g \left[H, \frac{b_2}{2} g(u, \eta_x) M_a \right] - g \left[V, \frac{b_2}{2} g(u, \eta_x) \delta_a \right], \end{aligned}$$

$$\begin{aligned}
\tilde{G} \left[H^h + V^v, \tilde{\nabla}_{\partial_a} \partial_b \right] &= \tilde{G} \left[H^h + V^v, \tilde{H}(\partial_a, \partial_b) \right] = \\
&g[H, A\nabla_{\delta_a} \delta_b] - a_2 R(H, \delta_b, u, \delta_a) - \\
&\frac{a_1}{2} [R(H, \delta_a, u, M_b + N_b) + R(H, \delta_b, u, M_a + N_a) + R(u, V, \delta_b, \delta_a) + \\
&g[V, a_1 \nabla_{\delta_a} (M_b + N_b)] + g[H, a_2 \nabla_{\delta_a} (M_b + N_b)] + \\
&g \left[H, \frac{b_2}{2} g(u, N_a) M_b + \frac{b_2}{2} g(u, N_b) M_a \right].
\end{aligned}$$

Here, along M ,

$$\nabla_{\delta_a} u = \nabla_{\delta_a} (v^y \eta_y) = \nabla_{\delta_a} \left(v^y N_y^r \frac{\partial}{\partial x^r} \right) = M_a + N_a..$$

Now we can deduce our main result.

Theorem 10 *Let M be a submanifold isometrically immersed in a manifold of constant curvature (N, g) .*

Suppose that:

- *the normal bundle of the lift LM defined by (3) is spanned by vectors of the form $H^h + V^v$, where H and V are tangent to M ;*
- *the van der Waerden-Bortolotti covariant derivative of unit vector fields normal to M vanishes, i.e.*

$$\overline{\nabla}_a N_x^r = 0;$$

•

$$\Gamma_{ax}^y = 0;$$

- *along M*

$$A = b_2 = 0.$$

Then LM is a totally geodesic submanifold of (TN, G) with non-degenerate g - natural metric G .
